

LiKang Front inserting coin acceptor LK799P(BLACK) manual v3.32

Product Features

1. Suitable for various of metal coins;
2. CPU process control, score accurately;
3. Special precise/normal stall, coin smoother;
4. Powerful prevent phishing and other means of cheating, with cheating alarm;
5. Excellent technology in circuit part, stable and reliable quality;
6. Double color light show receive coin, intuitively distinguish true or false coin;
7. Open cover design, completely solve the coins jamming and blocking;

Steps for usage

1. Take out the plastic coin from the slot, put your coin in;
2. According to machine's motherboard, select the output mode NC(normally close)/NO(normally open). Usually use NC stall
3. According to machine's motherboard, select the output pulse switch (25ms/50ms/100ms, usually use 25ms) ; ;
4. According to your coin, select the sensitivity. If you require a high accuracy, adjust it to "precision". If some true coins were misjudged as false coins, adjust it to "normal";
5. Install coin acceptor, it can be used after connecting power and signal wires.

A Step①: Pull up, remove the red example coin, then put your reference coin.

B Adjust the sensitivity slightly, the factory has adjusted to a reasonable position.

C Code table(gray)
Power 12V(red)
Signal output(white)
Power Ground(black)
Code table(gray)

D Step②: Set SW1 output mode, select NC/NO, the factory setting is NC.

E Step③: Set SW2, select the output pulse switch(25 ms/ 50ms/100 ms), the factory setting is 25ms.

F Step④: Set SW3, sensitivity switch, select precise/ normal, the factory setting is Normal.

4 pin connector wire can be option

G Mounting holes: With a square neck screw diameter of 4mm

H Coin slot: Please use the coins $\phi 20\text{mm} \sim \phi 29\text{mm}$, the thickness of the coins is 1.2mm~2.4mm.

I Indicator light :
★ No sample coin display red;
★ With sample coin display blue;
★ Insert true coin display blue flicker more than once;
★ Insert false coin display red flicker more than once;
★ Coin acceptor stop working when display red (or flickering red) .

J Coin bar;
When a larger diameter coin or a foreign body stuck, flip the level to exit the foreign coin.

K Coin mouth:
False coin/foreign body from here to exit.

Communication circuit

Coin detected "real coin", when the circuit gives a pulse signal (the pulse signal can be selected by the switch SW1, normally closed or normally open output; SW2 switch to select pulse width, see Figure 1)

The circuit output of this product is a triode collector or MOS tube drain open output, When it is used, users are advised to use optocouplers to receive signals when designing the interface circuit (see Figure 2).

Figure 1

Figure 2

The size diagram and effect diagram Unit:mm

Note: Band () is the relative size of the coin slot

Common abnormalities handling

A. Coin not passed

- 1.If there is poor contact in the coin power outlet;
- 2.If the wiring is correct;
- 3.If there is a foreign body in the coin track;
- 4.If power supply 12V is normal;
- 5.If the out mouth of coin is smooth;
- 6.If prototype is fit correctly;
- 7.If mounting depth is enough;
- 8.If there is a foreign body in the coin track, such as electric eye position is blocked.

B. Coin not score

- 1.If SW1 NO/NC is set matched;
- 2.If SW2 plus width is matched;
- 3.If the signal is connected well, if connection method is correct;
- 4.Coin signal and open collector output, if the target board is connected with pull-up resistor.

C. Coin not smooth

- 1.Adjust precise switch, precision stall: more stringent selection, commonly normal stall;
- 2.If prototype is fit correctly;
- 3.If coin slot is smooth, such as hopper tank depositing port and slot machine outlet slot are aligned;
- 4.Adjust VR knob, clockwise screening more relaxed, counterclockwise more strict.

D. Accept false coin

- 1.Adjust precise switch to precision stall;
- 2.Counterclockwise adjust VR knob (counterclockwise more strict)

E. Code mode doesn't move

- 1.If the wiring is correct (An end of the code table is connected with code table line, the other end of DC+12V);
- 2.If the code mode is bad;
- 3.Cable resistance is too large, resulting in power is below standard;
- 4.The power supply voltage and rated voltage code table required are the consistent.

Basic parameters

Operating voltage		DC12V±10%
Standby currency		< 50mA
Operating currency (Maximum current)		< 650mA
Operating temperature		-15℃~65℃
Output mode		OC.
Output signal		25ms/50ms/100ms
Coin diameter		20~29mm
Coin thickness		1.2~2.4mm
Angle assembly		-5°~5°
Individual packaging	Meas	161*69*131mm
	Gross weight	Without wire 291g
		With wire 300g
Carton packaging	Package	30PCS/SET
	Meas	51*37*28cm
	Gross weight	Without wire 9.43KG
		With wire 9.69KG

Assemble requirements

To prevent interference from adjacent signals, the adjacent mounting distance should be greater than 15mm.
